

The pump station includes our 3" Shinmaywa CNWX pumps on rails, gastight hatch cover, bronze swing check valves and sch 80 pvc piping with ball valves. The control panel converts 230V single phase to three phase using VFD's with 4 float functionality and an alarm dialer. The owner stepped it up by connecting the system to a generator so it has power during PG&E blackouts.

The picture to left and the one on the upper right corner were taken from the same spot. This pump station no longer has odor issues, Shinmaywa pumps will not clog on a daily basis and the controls were moved over to the left of the pump station yard area to create space for the gantry.
